

# coding in python

week 3

# this week's topic

- ❑ this is where the fun begins!
- ❑ we will spend the next two weeks working on loops and data structures
- ❑ this week, we will be learning about for loops and lists

first, let's go over last week's assignment

- ❑ a game for guessing numbers

# what is a loop?

- ❑ loops are what we use to really use the power of computers
- ❑ loops do things over and over again

# why would we use loops?

- ❑ hopefully this should be obvious
- ❑ loops allow us to make our computers do things over and over again
- ❑ this is exactly what computers are good at!

# we've seen loops in action before

- ❑ remember our exercise with the circles
- ❑ also, remember last week's assignment

# this week, we will only be looking at **for** loops

- ❑ **for** loops are used to make our computer go through a list of things
- ❑ it is pretty easy to create a for loop
  - ❑ thank python for this!

let's say we want to go through a list of things called `my_list`

```
>>> for thing in my_list:
```

```
>>>     do something
```

# the parts of the for loop

## ❑ **for**

- ❑ tells python that we are creating a for loop

## ❑ **thing**

- ❑ the variable that is assigned to the value we look at

## ❑ **in**

- ❑ **in** tells python that the variable is **in** the list

## ❑ my\_list

- ❑ the list we want to iterate through
- ❑ the word iterate will come up often

## ❑ do something

- ❑ this just means that anything below the for loop that is indented will be done for each iteration

# what is a list?

- ❑ for loops need to be able to go through a list, so how do we make one?
- ❑ a list is just a list of values!
- ❑ we create a list by putting brackets around the values
- ❑ we can assign it to a variable as well

```
>>> shopping_list = ['apples', 'oranges', 'pears', 'peaches']
```

# exercize

- ❑ create a list that represents shopping list
- ❑ make sure to put stuff inside it, like apples, oranges, etc.
- ❑ we will use this list later

# editing a list

- ❑ the good thing about lists is that you can change them
  - ❑ it is a lot simpler in python than other languages
- ❑ there are many things you can do, but for now we only need to worry about several important ones

- ❑ to add something, use `append()`

```
>>> shopping_list.append('watermelons')
```

- ❑ to remove something, use `remove()`

```
>>> shopping_list.remove('oranges')
```

- ❑ to add two lists together, we can just use `+`

# exercise

- ❑ use the shopping list
- ❑ add two things to the list, such as orange juice or milk
- ❑ remove something from the list
- ❑ print the list to check

# indexing

- ❑ another really great things about lists is that you can grab specific things from the list by their position
- ❑ to do this, we use brackets

```
>>> fruit = shopping_list[index]
```

# remember!

- ❑ almost all programming languages start counting from 0
  - ❑ the first value's index is 0, the second value's index is 1, etc.
- ❑ this is because these numbers represent positions in our computer's memory

# here's something cool!

- ❑ the last thing in a list has an index of -1

# let's try this out!

- ❑ use the same shopping list
- ❑ print the first value, the third value, and the last value

# here's something else that's cool!

- ❑ we can treat string just like lists!
  - ❑ indexing, loops

# iterating numbers

- ❑ this might seem strange...
- ❑ but what this means is that we iterate that number of times
- ❑ to do this, we use the `range()` function
  - ❑ `range()` creates a sequence of numbers up to, but not including, the given number

# how do we use this?

- ❑ `range()` is useful because we can now do something a set number of times
- ❑ it basically creates a list, though not really

# try it out!

- ❑ try and write a for loop that will print a message 5 times

## exercise/homework

- ❑ write a program that is a countdown for a rocket ship
- ❑ don't make a list of numbers, find another way to do it
- ❑ good luck
